Basic Timer (Timer)

The Basic Timer module can be used to devide the system clock frequency to a user defined periodic signal required by the application. For this purpose the Basic Timer provides a configurable prescaler. If enabled, the prescaler allows the usage of all powers of two between 2 and 256 as prescaler value. The input of prescaler block could be connected to the system clock, a dedicated DCM output or to the output (data register) of a previous timer module. The output of the prescaler is used as input of an 18 bit counter which counts up to a programmable value and restarts afterwards.

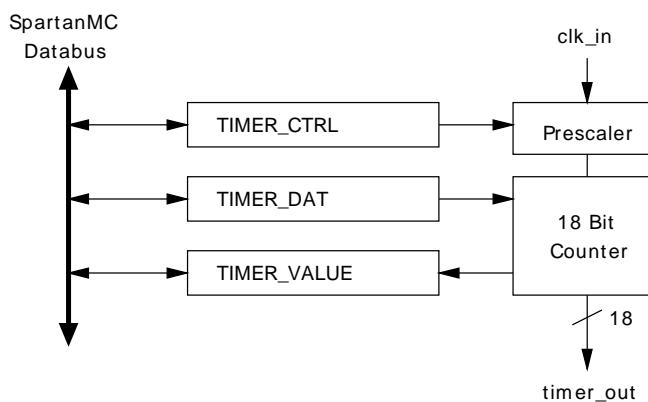

Figure 1: Timer block diagram

The basic timer could be used for the following peripherals: Real Time Interrupt (RTI), Watchdog, Capture-, Compare-Module and Pulse-Accumulator-Module. The capture-and compare-module require on their input a complete 18 bit counter register output. While all other modules (RTI, Pulse-Accumulator, Watchdog and additional basic timer) require only one single output bit for their clock input.

1. Module parameters

Table 1: TIMER module parameters

Parameter	Default Value	Description
BASE_ADR	0x10	Start address of the memory mapped peripheral registers. The value is taken as offset to the start address of the peripheral memory space. This parameter is set by jConfig automatically.

2. Peripheral Registers

2.1. Timer Register Description

The timer peripheral provides three 18 bit registers which are mapped to the SpartanMC address space e.g. 0x1A000 + BASE_ADR + Offset.

Table 2: TIMER registers

Offset	Name	Access	Description
0	TIMER_CTRL	read/ write	Configuration of the timer.
1	TIMER_DAT	read/ write	Maximum value of the 18 bit counter.
2	TIMER_VALUE	read/ write	Current counter value.

2.2. TIMER_CTRL Register

Table 3: TIMER_CTRL register layout

Bit	Name	Access	Default	Description
0	TI_EN	read/ write	0	If set to one the timer is enabled.
1	TI_PRE_EN	read/ write	0	If set to one the prescaler is enabled.
2-4	TI_PRE_VAL	read/ write	000	Sets the prescaler value : 000 = 2^1 001 = 2^2 010 = 2^3 011 = 2^4 100 = 2^5 101 = 2^6 110 = 2^7 111 = 2^8
5-17	x	read	0	Not used.

Table 3: TIMER_CTRL register layout

2.3. TIMER_DAT Register

Table 4: TIMER_DAT register layout

Bit	Name	Access	Default	Description
0-17	Max Counter	read/write	x	Register for the maximum counter value.

2.4. TIMER_VALUE Register

Table 5: TIMER_VALUE register layout

Bit	Name	Access	Default	Description
0-17	Main Counter	read/write	0	Register for the current counter value. The content of this 18 bit register is used as timer_output and could be connected to other peripherals e.g. capture- or compare-logic. A single bit of this register could also be used to cascade multiple timers.

2.5. TIMER C-Header for Register Description

```
#ifndef __TIMER_H
#define __TIMER_H

#ifndef __cplusplus
extern "C" {
#endif

#define TIMER_EN          (1<<0)
#define TIMER_PRE_EN      (1<<1)
#define TIMER_PRE_VAL     (1<<2)           // *0 fuer 2^1 bis *7 fuer
2^8
#define TIMER_PRE_2       (TIMER_PRE_VAL * 0)
#define TIMER_PRE_4       (TIMER_PRE_VAL * 1)
#define TIMER_PRE_8       (TIMER_PRE_VAL * 2)
#define TIMER_PRE_16      (TIMER_PRE_VAL * 3)
#define TIMER_PRE_32      (TIMER_PRE_VAL * 4)
#define TIMER_PRE_64      (TIMER_PRE_VAL * 5)
#define TIMER_PRE_128     (TIMER_PRE_VAL * 6)
#define TIMER_PRE_256     (TIMER_PRE_VAL * 7)

typedef struct timer {
```

```
volatile unsigned int control;
volatile unsigned int limit;
volatile unsigned int value;
} timer_regs_t;

#ifndef __cplusplus
}
#endif

#endif
```
